Volcanoes!

A LOOK AT THEIR IMPACT TO HUMANS

INSPIRATION

INSPIRATION

IT ALL STARTED HERE...

Mt. Etna; Sicily, Italy
Sept 2013

INSPIRATION

WITH A CLIMB UP THE LAVA FIELDS...

Mt. Etna; Sicily, Italy
Sept 2013

INSPIRATION

ONTO A SIDE CRATER AND DOWN INTO A LAVA TUBE...

Mt. Etna; Sicily, Italy
Sept 2013

INSPIRATION

SINCE THEN...

Clockwise:
Mt. Vesuvius; Naples,
Italy; Sept 2013

Arenal; La Fortuna,
Costa Rica; Oct 2015

Irazu; Cartago, Costa
Rica; Oct 2015

Poas; Alajuela, Costa
Rica; Oct 2015

THE PROBLEM

THE PROBLEM

WHAT IS THE PROBLEM?

- ▶ Data analyses are buried in research papers and data tables
- ▶ Available resources are very dense and text heavy
- ▶ Data communicated in very scientific terminology
- ▶ Requires reader to consolidate from disparate sources

THE PROBLEM

WHY IS THE PROBLEM IMPORTANT?

- ▶ Population proximity to volcanoes
- ▶ Understanding hazards and risk reduction
- ▶ Impact to travel plans

AUDIENCE

THE AUDIENCE

WHO IS THE AUDIENCE?

- ▶ Phase 1: General Public and Students
 - ▶ Specifically readers of Wired, NatGeo, NYT, and WaPo
- ▶ Later Phases: More scientific community

WHY THIS AUDIENCE?

- ▶ Most volcano publications written for scientific community or elementary school
- ▶ Already interest via Wired

THE AUDIENCE

HOW DID THEY INFLUENCE THE PROJECT?

- ▶ Find balance between scientific and approachability
- ▶ Need design elements to grab attention
- ▶ Information consumed digitally over print
- ▶ Able to handle large volumes of information but need in chunks

WHAT OTHER AUDIENCES COULD BE INTERESTED?

- ▶ Schools
- ▶ Outreach departments for organizations like USGS and SI's GVP

DATA COLLECTION AND ANALYSIS

DATA COLLECTION AND ANALYSIS

WHERE DID THE DATA COME FROM?

- ▶ Smithsonian Institution's Global Volcanism Program
- ▶ NOAA's Natural Hazards Database
- ▶ Center for Research on the Epidemiology of Disasters (CRED) - International Disaster Database
- ▶ Volcanoes of the World, 3rd Edition
- ▶ USGS

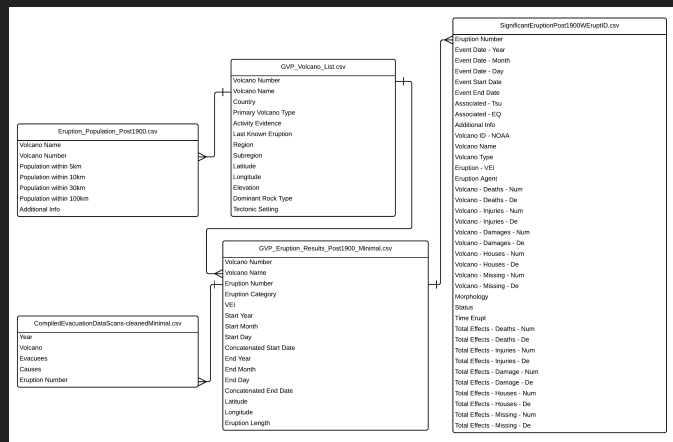

WHAT WERE THE DATA CONCERNS?

- ▶ Different numbering schemas for volcanoes between sources
- ▶ Data not easily exportable/downloadable
- ▶ Some data only in print and had to be digitized
- ▶ Unknown data criteria and symbol meaning
- ▶ Data gaps

HOW WAS THE DATA CLEANED?

- ▶ Tools: R and Excel
- ▶ Crosswalk data between two volcano numbering schemas
- ▶ Crosswalk eruption and significant eruption data
- ▶ Consolidate significant eruption data from multiple sources

WHAT WAS THE RESULTING DATA STRUCTURE?

WHAT DID I LEARN DURING THE ANALYSIS?

- ▶ Volume of volcanoes and eruptions around the world
- ▶ United Nations initiative relating to disaster reduction

WHAT SURPRISED ME DURING THE ANALYSIS?

- ▶ For a subject that is highly scientific requires massive coordination, there weren't consolidated sources including human impact
- ▶ Fatalities often were not from the eruption itself

DATA COLLECTION AND ANALYSIS

WHAT KINDS OF QUESTIONS CAME UP DURING THE ANALYSIS?

- ▶ Understanding of what happens after the eruption
- ▶ Comparing impact to other events
 - ▶ Natural disasters (earthquakes, fires, tsunamis)
 - ▶ Other unpredictable disasters (car and plane crashes)

HOW DID THE DATA INFLUENCE THE DESIGN?

- ▶ Data volume available for breakouts

DESIGN AND DEVELOPMENT

WHAT IS THE SOLUTION?

- ▶ Interactive visualization
- ▶ Educational and consolidated information source
- ▶ Focus on:
 - ▶ Providing context
 - ▶ Correlate scientific concepts and impact
 - ▶ Illustrate impact and proximity

WHY AN INTERACTIVE AND WHAT IS ITS VALUE?

- ▶ Interactive visual representation increases:
 - ▶ Accessibility
 - ▶ Likelihood of consumption
- ▶ Empower learning about areas we live or travel to
 - ▶ Basic volcanic information
 - ▶ Disaster risk reduction
 - ▶ Disaster recovery and relief
- ▶ Increase interest and subsequent help with data gathering
- ▶ Provides mechanism to push new information without meeting/printing

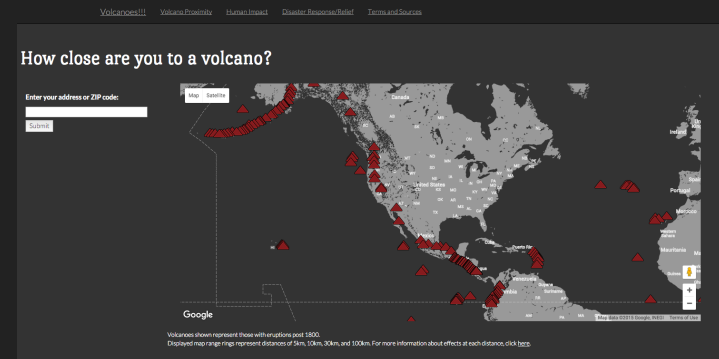

WHAT IS THE STRUCTURE?

- ▶ Design is broken into four sections - proximity, human impact, disaster relief, and terms

[Volcanoes!!!](#) [Volcano Proximity](#) [Human Impact](#) [Disaster Response/Relief](#) [Terms and Sources](#)

WHAT ARE THE KEY STORY ELEMENTS AND WHY?

- ▶ For reaching the audience
 - ▶ Map of learning your proximity to a volcano

WHAT ARE THE KEY STORY ELEMENTS AND WHY?

- ▶ For flow
- ▶ Navigation guiding the educational path

[Volcanoes!!!](#) [Volcano Proximity](#) [Human Impact](#) [Disaster Response/Relief](#) [Terms and Sources](#)

WHAT ARE THE KEY STORY ELEMENTS AND WHY?

- ▶ For illustrating its purpose
- ▶ VEI and Proximity relationship
- ▶ VEI and Impact relationship

[VEI and Proximity](#) [Volcano Proximity](#) [Human Impact](#) [Disaster Response/Relief](#) [Terms and Sources](#)

Do you know the impact volcanoes have on humans?

To better prepare for possible volcanic activity, it is important for the world's population to understand how volcanoes have impacted humans. We will begin by looking about the eruption VEI (VEI of historical study that lasted 1800 CE, which is not a VEI of 5). Then, we will look at the impact of the eruption of Mount St. Helens in 1980 CE, which was a VEI of 5. Then, we will look at the impact of the eruption of Mount St. Helens in 1980 CE, which was a VEI of 5. Then, we will look at the impact of the eruption of Mount St. Helens in 1980 CE, which was a VEI of 5.

Understanding VEI

Volcanic Eruption Index (VEI) is a scale that was created in the 1980s to be able to compare the size of volcanic eruptions. The VEI is based on a number of factors including volume of magma, amount of ash produced, and the height of the eruption plume. The VEI is based on a number of factors including volume of magma, amount of ash produced, and the height of the eruption plume. The VEI is based on a number of factors including volume of magma, amount of ash produced, and the height of the eruption plume.

VEI	1	2	3	4	5	6	7	8	9	10
Frequency	1000	100	10	1	0.1	0.01	0.001	0.0001	0.00001	0.000001
Volume (km ³)	<0.1	0.1-1	1-10	10-100	100-1000	1000-10000	10000-100000	100000-1000000	1000000-10000000	>10000000
Height (km)	<0.1	0.1-1	1-10	10-100	100-1000	1000-10000	10000-100000	100000-1000000	1000000-10000000	>10000000

The VEI scale grows from 0 to 10, with a factor of 10 increase in explosivity between each number.

Understanding VEI versus Proximity

This section describes the average impact of eruptions at standard distances (10km, 100km, 1000km). The descriptions describe the types and geographic distribution of each of the distances. The descriptions describe the types and geographic distribution of each of the distances.

DESIGN AND DEVELOPMENT

WHAT TECHNOLOGIES WERE USED?

- ▶ Adobe Creative Suite
- ▶ HTML
- ▶ CSS
- ▶ Highcharts
- ▶ Javascript / JQuery
- ▶ Google Maps API

WHAT TESTING WAS COMPLETED?

- ▶ Tested across several browsers and devices
- ▶ User testing with friends and colleagues
 - ▶ Captured list of feedback

FINAL SOLUTION

ARE YOU READY FOR THE FINAL SOLUTION?

► Site: <http://mica.thisisja.net/thesis-volcano-final.html>

Volcanoes!!! Volcano Proximity Human Impact Disaster Response/Relief Terms and Sources

How close are you to a volcano?

Enter your address or ZIP code:

Closest Volcanoes	Distance
Irazu	17 mi
Barú	17 mi
Parícuti	35 mi
Poas	45 mi
Arenal	81 mi

Click a volcano marker on the map to see more information about the volcano

Google
Volcanoes shown represent those with eruptions post-1800.
Displayed map range rings represent distances of 5km, 10km, 20km, and 100km. For more information about effects at each distance, click here.

FUTURE EXPANSION

WHAT ARE PROJECTED FUTURE ENHANCEMENTS?

- ▶ Highlight new and on-going volcanic activity
- ▶ Find more evacuation and displacement data
- ▶ Connect visualizations directly to data sources
- ▶ Integrate earthquake data and look into predictive modeling
- ▶ Inclusion of the good things (e.g., crops)

QUESTIONS?
